Week : 1

Exercise : 1

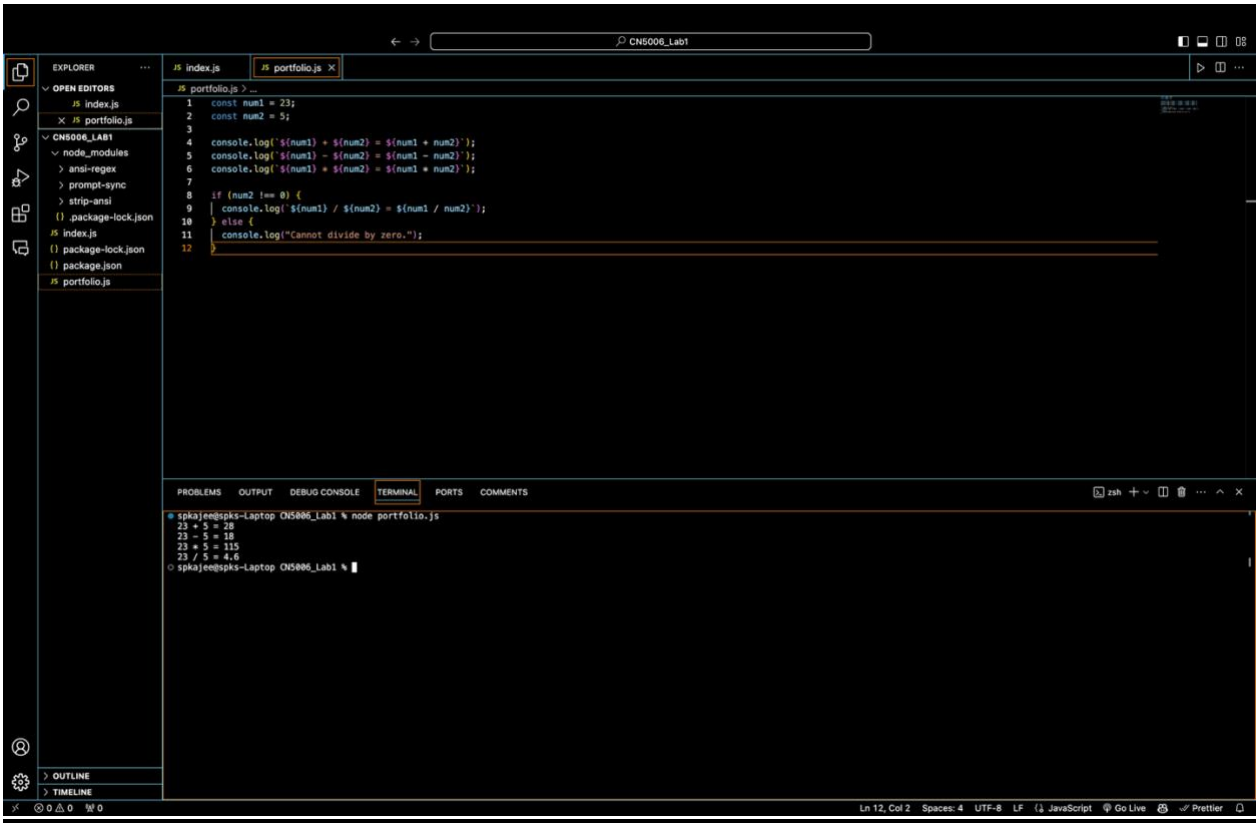

Exercise : 2

Portfolio Exercise

Reflection

During this week's lab, I learned how to create and run a JavaScript program using Visual Studio Code and Node.js. I practised displaying messages, adding numbers, and using user input and if statements to check whether a number is positive, negative, or zero.

At first, I had difficulty running my program because node.js could not find the prompt-sync package. I learned that I needed to install the package in my project folder. I also learned that I must save index.js in the correct folder and run the terminal command from that same folder.

One key insight I gained is that JavaScript can respond to information entered by the user, not just print fixed messages. I also learned that small details, such as using backticks for text interpolation, can affect how a program works.
